

KLIAR-BX1 Jet Black opaque E-coating (1 L)

- Jet-Black colored e-coating
- Opaque & medium gloss
- Highly corrosion resistant
- 5-25 micron of thickness

KLIAR-BX is a jet black e-coating for electrophoretic deposition. This polyurethane based paint deposits a layer which is opaque and is able to hide any substrate surface defects. The achievable thickness range is 5-25 micron. The final coating can be considered a medium gloss and can be used either a base coat primer, prior to a top coat, or as a final surface finish due to the visually appealing dark black color. The paint has a very high resistance to corrosion and UV light, while maintains a medium resistance to abrasion.
